RE: CEMATRIX Cellular Concrete

Our project had lots of underground spools, concrete lines, and manholes making backfill a challenge. With hundreds of foundations and pedestals scattered around the site, just getting the equipment into the areas to work was difficult.

CEMATRIX as a substitute to backfill was a good choice for this project because it simplified the installation of the material (i.e., backfill) required under paving. **Using CEMATRIX as a replacement for all these different materials saved time and money on the project.**

Not only can you use it as a working surface the day after it is poured, **CEMATRIX saves on equipment, labour, and material (backfill) costs.** I know I would absolutely use this product on any future project I am involved with.
